 Data are based on the DFA's annual survey of domestic firms. The survey covers the period 2008-2010. The survey data are used to calculate the entry, exit, and survival rates of domestic firms. The entry rate is defined as the number of new firms that enter the market in a given year. The exit rate is defined as the number of firms that exit the market in a given year. The survival rate is defined as the number of firms that survive in the market in a given year. The data are presented in the table above.
